

AI WEATHERWISE

Proposed Solution Template

Team ID	UNM1737WeatherWise
Project Name	AI WeatherWise – AI-Powered Weather Information and Insights System
Date	30 September 2026
Maximum Marks	2 Marks

1. Problem Statement (Problem to be solved)

Weather information is often presented as raw data that may be difficult for users to understand and apply to daily activities. Users need a simple system that provides current weather information, forecasts, and useful insights in an easy-to-understand format.

2. Idea / Solution description

AI WeatherWise is a web-based AI-powered weather information and insights system. It collects weather data through a weather API and presents current conditions, forecasts, and relevant weather insights through a simple user interface. The system is designed to help users understand weather conditions quickly and make better day-to-day plans.

3. Novelty / Uniqueness

The uniqueness of AI WeatherWise is the combination of real-time weather information with AI-based interpretation. Instead of only displaying temperature and weather values, the system focuses on converting weather data into simple, meaningful insights that are easier for users to understand.

4. Social Impact / Customer Satisfaction

AI WeatherWise can help students, travelers, workers, farmers, and the general public access understandable weather information. Clear weather insights can support daily planning, travel decisions, outdoor activities, and awareness of changing weather conditions, improving user convenience and satisfaction.

5. Business Model (Revenue Model)

The basic version can be offered as a free weather information service. Possible revenue sources include advertisements, premium features, subscription plans, customized weather insights, and partnerships with organizations that need weather-related information.

6. Scalability of the Solution

The solution can be scaled by supporting more locations, additional weather APIs, longer-range forecasts, multilingual support, mobile applications, notifications and alerts, personalized weather recommendations, and integration with other platforms. The system can also be enhanced with additional AI features as usage grows.
